Garbage Collector - Dremák Gergely

EREDETI SPECIFIKÁCIÓ

Leírás

3 fajta "okos" pointer osztály a <memory> analógiájára:

- **Unique pointer**: Egyetlen példány van belőle, amint kikerül a scope-ból feltakarít maga után.
- <u>Shared pointer</u>: Egy counter van a háttérben ami számon tartja a referenciák számát a memória területre. Ha ez 0 a memória felszabadul.
- Weak pointer: Effektíve egy átlagos pointer, de meg lehet kérdezni tőle, hogy a memória amire mutat tartalmaz-e még értelemes adatot (törölve lett-e), illetve lehet promotálni a másik 2 pointer típussá.

Deklarálás példa (a név és szintaxis változtatás jogát fenntartom):

```
class T {
    T(...args);
    void doSomething();
};
int main(void) {
    SharedPointer<T> ptr = SharedPointer::Init<T>(...args);
    // vagy
    SharedPointer<T> ptr(new T(...args));

ptr->doSomething();
    // <- Destruktor hívás
}</pre>
```

Tulajdonságok

• STL kollekciók

Teszt

A *memtrace* a nagyrészét intézi, nyilván a shared pointer a trükkösebb, mert lehet, hogy több thread is használja illetve függvényekben megfelelően inicializálódik = növekszik-e a counter.

Egyéb kérdés esetén a <memory> könyvárral történő konzultálást javasolom mert sok lesz a párhuzam.

Detailed Description

template<class T>

class HF2::ControlBlock< T[]>

Vektorális Pointer tárolására.

A setPtr<T[]>(...) potenciálisan a blokkot használó objektumok offsetjének a túlindexelését jelentheti, exception-t meg inkább nem dobatok vele mert általános használat közben könnyen elkerülhető egy ilyen probléma, feliratkozós; callbackes; event emitteres; frissítés meg már sok lenne ide. Szóval bízok a felhasználóban. Mellesleg javallott a ++/- operátorokat csak loopokon belül használni és a végén 0-ba állítani Definition at line 74 of file hf2_control_block.hpp.

T *	<pre>operator-> () const jelenleg offsettel kiválaszott elem tagjának hozzáférése</pre>
Т 8	<pre>operator* () const jelenleg offsettel kiválaszott elem dereferálása</pre>
bool	<pre>operator== (const T *t) const t != ctrl>t + offset</pre>
bool	<pre>operator!= (const T *t) const t != ctrl>t + offset</pre>
bool	<pre>operator== (const Abstract_SmartPointer < T > &sp) const sp.ctrl>t == ctrl>t + offset</pre>
bool	<pre>operator!= (const Abstract_SmartPointer< T > &sp) const sp.ctrl>t != ctrl>t + offset</pre>

bool <u>operator==</u> (const <u>Abstract_SmartPointer</u>< T[]> &sp) const

sp.ctrl ->t + sp.offset == ctrl ->t + offset

bool <u>operator!=</u> (const <u>Abstract_SmartPointer</u>< T[]> &sp) const

sp.ctrl ->t + sp.offset != ctrl ->t + offset

Additional Inherited Members

▼ Protected Member Functions inherited from HF2::Abstract_SmartPointer
T[]>

Abstract_SmartPointer (T *t, std::size_t size)
"új" pointer inicializálás

Abstract_SmartPointer (ControlBlock T[]> *ctrl)
létező pointerrel osztozkodás

▼ Protected Attributes inherited from HF2::Abstract SmartPointer< T[]>
ControlBlock< T[]> * ctrl = nullptr
Pointer kontrollblokkra.

std::size_t offset_ = 0U
Bármikor módosítható offset.

Detailed Description

template<class T>

class HF2::SharedPointer< T[]>

Autómatikusan törlődő tömb pointer.

Lehetőleg *ne* dinamikusan allokáljuk. Mozgató konstruktorok és operátorok az std::move()-val használhatók

Definition at line 70 of file hf2 shared ptr.hpp.
